

**Information sheet for the course**  
**Properties and structure of glass and other inorganic materials: research methods.**

<b>University:</b> Alexander Dubček University of Trenčín	
<b>Faculty:</b> VILA – Joint Glass Centre	
<b>Course unit code:</b> SSVSAM	<b>Course unit title:</b> Properties and structure of glass and other inorganic materials: research methods.
<b>Type of course unit:</b> optional	
<b>Planned types, learning activities and teaching methods:</b> Lecture: 2 hours weekly	
<b>Number of credits:</b> 3	
<b>Recommended semester:</b> 2. semester in the 1 <sup>st</sup> year (full-time)	
<b>Degree of study:</b> II. (engineer)	
<b>Course prerequisites:</b> none	
<b>Assesment methods:</b> Written test, student must get at least 50% of points otherwise no credits will be awarded.	
<b>Learning outcomes of the course unit:</b> Student will learn principles of instrumental methods which allow to study structure and properties of inorganic materials. Included are spectral methods (such as atomic emission and absorption spectroscopy, molecular absorption spectroscopy, infrared spectroscopy, roentgen diffraction, X-ray fluorescence spectroscopy), thermal methods (such as differential thermal analysis, thermogravimetric analysis, differential scanning calorimetry, thermomechanic analysis) and other measurements such as chemical resistance, thermal expansion and viscosity of glass.	
<b>Course contents:</b> <ol style="list-style-type: none"><li>1. Atomic emission and absorption spectroscopy</li><li>2. Molecular absorption spectroscopy (UV/VIS spectroscopy)</li><li>3. Infrared and raman spectroscopy</li><li>4. X-ray diffraction</li><li>5. X-ray fluorescence spectroscopy</li><li>6. Differential thermal analysis</li><li>7. Thermogravimetric analysis</li><li>8. Differential scanning calorimetry</li><li>9. Thermomechanic analysis</li><li>10. Thermal expansion</li><li>11. Viscosity of glass</li><li>12. Impedance spectroscopy</li><li>13. Electric conductivity</li></ol>
